Abstract (en)

[origin: WO2012127052A1] The invention relates to a jumper (30, 40) for a timepiece movement (10), said jumper being of the type that comprises a base (42) and an elastically deformable arm (80) extending from said base (42) and provided with an abutment surface (82) for co-operating with a notch of a mobile element (222, 242). The base (42) comprises a supporting element (52) carrying said arm (80). It comprises two connection elements (54, 56) each connecting an end of the supporting element (52) to a fixed element (420) of the base (42). The jumper (30, 40) is associated with a control body (86) arranged such that an axial rotation of said control body (86) causes a displacement of said supporting element (52) by deformation of a frame (55), the sides of which are formed by the supporting element (52) and two connecting elements (54, 56).
