Abstract (en)

[origin: EP2690246A1] A screening arrangement (1) has a top element (4) provided with a top rail (440) forming the front side of the top element. Side rails (8, 9) are adapted to be joined to mitred ends of the top rail (440) by means a set of angular brackets cooperating with reception means in the back side of the top rail (440) and in the back side of the respective side rail (8, 9). A set of angular brackets (85) is provided, each angular bracket (85) having a substantially plane configuration and including a first leg (850) and a second leg (860). The first and second legs (850, 860) are positioned substantially in parallel with said plane in the mounted position. Reception means are provided as a track in the back side of the top rail (440) and a track in the back side of each side rail (8, 9), respectively. The second leg (860) is adapted to be inserted into the track (820) in the back side of the side rail (8, 9), one edge of the second leg (860) having an inclined portion (863).
