Abstract (en)
[origin: WO2012130974A1] There is provided a cutting board system having a rigid support base and a slab defining a work surface for cutting food products. The slab is removably associated with the support base, and the support base holds a plurality of retaining elements and the slab is provided with corresponding retaining openings. Each retaining element has a head part on top of a shoulder part on top of a body part, and the head part has a larger cross-sectional area than the shoulder part. The body part is inserted in a corresponding recess of the support base, and the height and cross-sectional area of the shoulder part are fitted to the thickness of the slab and the cross-sectional area of a retaining opening of the slab. The upper surface of the head part is covered upwards and the cross-sectional area of the retaining openings is slightly smaller than the cross-sectional area of the head part of the retaining elements. When the slab is fixed to the support base via the retaining elements and retaining openings, the lower surface part of the head part of each retaining element covers the enclosing wall of the corresponding retaining opening of the slab.
