Abstract (en)
[origin: WO2012130889A1] The invention relates to a positioning system comprising at least one GNSS satellite receiver (100) which is located on board a mobile element belonging to a user u and which is used to estimate the position X_u of the mobile element at different moments, and a first processing module (102) that determines a coherence indicator $\text{coh}(X)$ by combining the estimated positions $X_u[t]$ and data supplied by secondary information sources (101, 102). A dynamic model for moving the mobile elements to be positioned is used. The indicator is determined by comparing a speed, acceleration, gyration $[v, a, g]$ triplet, derived from direction and speed measurements taken by the mobile element, to a dynamic model for moving an object, vehicle, person or animal to be positioned. The system comprises: a consolidation module (104) including means for storing the positions $X_u[t]$ estimated at different moments t by user u; and a digital filter that can be used to obtain a filtered position $X_f[t]$ from the stored positions $X_u[t]$ of a user, the coherence indicator $\text{coh}(X)$ being calculated from the filtered positions $X_f[t]$. The system further comprises detection means (105) for determining, on the basis of the coherence indicator $\text{coh}(X)$, whether or not the estimated positions $X_u(t)$ have been falsified.
