Abstract (en)
[origin: EP2692255A1] The present invention provides a garment with cup portions, which can reduce the bounce of breasts during exercise effectively, while keeping the shape of the breasts without squashing the breasts when it is worn. In each cup portion 101 of the garment having cup portions, a support member 110 is provided so as to extend along the periphery of the swell of a wearer's breast. The support member 110 includes a lower support member 110A and an upper support member 110B. The lower support member 110A is stretchable in a direction connecting the front center side and the lateral side of the cup portion 101. The upper support member 110B is non-stretchable or slightly stretchable in a direction orthogonal to the above-described direction. At least part of a front center side-portion and at least part of a lateral side-portion of the upper support member 110B are fixed to the garment. At least part of a lateral side-portion of the lower support member 110A is fixed to the garment so that the lower support member 110A is displaceable relative to the cup portion 101.
