Abstract (en)

[origin: EP2692440A1] The reagent vessel insert (10) has insert housing (10a) in which agitating element (12) is arranged in interior volume (14) such that place and/or position of agitating element is changeable with respect to housing. A holding structure (20) holds agitating element in semi-stable place and/or semi-stable position with respect to housing. The agitating element has subunit (16) which is adjusted along adjusting path (18) to enable agitation of material filled into interior volume, and is contacted to holding structure during adjustment. Independent claims are included for the following: (1) reagent vessel; (2) method for centrifuging of material; and (3) method for pressure treatment of material.
