Abstract (en)  
Device for mounting a roof light in an outer construction in a building. The device comprises a support unit (2,16) comprising an abutting surface (3) for abutting against an underside (26) and an abutting surface (4) for abutting against a foundation (28), a rotatable arm (7), which can be connected to the support unit (2, 16) in at least one first point, around which the arm can rotate, a hoist (11) comprising a wire (12) where the wire can be connected to a gripping device (13) and where the wire is led through at least one control device (10) arranged on the arm. The device comprises a connection element (14), which can be connected to at least one other point on the arm and at least a third point on the support unit, such that the slope on the arm can be adjusted. It is hereby possible for one man to lift and control the roof light in place. Furthermore, the device can be compressed and easily assembled and disassembled.
