Abstract (en)
[origin: WO2012135968A1] In order to produce a can body (27) having a can jacket (19) extending around a can axis in the circumferential direction, which can jacket is closed in the circumferential direction by means of an adhesive connection between contact areas (18, 18') of an overlapping region (20), a strip material (1) having the flat material regions for the can jackets (19) is guided through a printing device (2) in the longitudinal direction of the strip material and is continually printed with decorative areas (17), wherein first contact areas (18) are provided respectively next to the decorative areas (17). The flat material regions for the can jackets (19), each having a decorative area (17) and the adjacent first contact area (18), are separated from the printed strip material (1) and shaped into can jackets (19).
