Abstract (en)
[origin: WO2012136373A2] The present invention relates to a device (300) for printing a series of elements in the form of sheets, including a platen press (310) capable of depositing, onto each sheet and by stamping between a static platen (320) and a movable platen (330), a colored or metalized film from at least one strip to be stamped (411), as well as a heating member (340) capable of raising any stamping tool secured to the static platen (320) to a given temperature in order for the stamping operation to be carried out under hot conditions within the platen press (310). The invention is characterized in that the heating member (340) is mounted so as to be movable between an operating position, in which the heating member is inserted between the static platen (320) and each stamping tool associated with said static platen (320), and a maintenance position, in which the heating member is positioned outside the platen press 310.
