Abstract (en)

[origin: WO2012134403A2] A technical problem solved by the invention is a constructional solution to a fastening element that must enable carrying, stirring and squeezing various ingredients, like tea, coffee, condiments and the like. The essence of the fastening element for handling an ingredient container of the invention lies in that the constructional shape of the fastening element enables carrying, stirring and squeezing various containers independently or in a combination with a glass lid, wherein the containers may contain tea, coffee, condiments and similar ingredients. The fastening element has a form of an elongate flat stick provided in its bottom part by a fastening section for attaching the container. Combined with a specially shaped plastic lid with a system for attachment, which is attached to a cup containing liquid, the container is suited for a preparation of either a cold or a hot beverage, wherein the fastening element allows a simple displacement from a horizontal into a vertical position as well as stirring and squeezing the container's content.
