Abstract (en)  
[origin: WO2012143648A1] The invention relates to a device which includes an organic polymer layer (1) and an electrode (3) positioned against the polymer layer, the electrode (3) consisting of a transparent stack of thin films including an alternation of n metal thin films (31) and (n + 1) antiglare coatings (M<sub>i</sub>)<sub>1=i=n+1</sub>, where n = 1, wherein each metal thin film is arranged between two antiglare coatings (M<sub>i</sub>). At least one of the two antiglare coatings located at the ends of the stack constituting the electrode (3) comprises a gas- and moisture-barrier stack (B1), the densities of the layers of said or each barrier stack alternating between a lower density and a higher density.
