Abstract (en)

[origin: WO2012136345A2] A system for visually displaying information on real objects comprises a projection unit (14) for graphically or pictorially transmitting an item of information to an object and is characterized by a dynamic tracking device having a 3D sensor system for determining and keeping track of the position and/or location of the object and/or of the projection unit (14) in space, and a control device for the projection unit (14), which control device adapts the transmission of the information to the current position and/or location of the object and/or of the projection unit (14), as determined by the tracking device. A method for visually displaying information on real objects using a projection unit (14) comprises the steps of: determining the current position and/or location of the object and/or of the projection unit (14) in space; graphically or pictorially transmitting an item of information to the object on the basis of the determined position and/or location; detecting and determining a change in the position and/or location of the object and/or of the projection unit (14); and adapting the transmission of the information to the changed position and/or location of the object and/or of the projection unit (14).
