Abstract (en)

[origin: EP2696013A2] The automatic lock (5) has a lock case that is arranged oppositely to a metal sheet. A push button is arranged to detect the position of the lock case against the metal sheet. A controllable trigger is provided to release the movement of the latch from the open position to the closed position. The push button is arranged to bias a guide portion of non-magnetic material, in the direction of the metal sheet, such that a magnet on the guide portion is displaced in the metal sheet and the movements of the trigger are coupled with the magnets.
