Abstract (en)
[origin: EP2696147A1] It is a problem of the present invention to provide, in relation to an air conditioning indoor unit disposed with an air inlet adjacent to the rear side of an air outlet, an air conditioning indoor unit that suppresses the occurrence of air stagnation and prevents the occurrence of short-circuiting. In an air conditioning indoor unit (2), a first air inlet (21) is disposed, whereby air convection occurs as far as places that the air did not reach with conventional circulation methods and the occurrence of air stagnation is suppressed because the first air inlet (21) is opened when blowing out the air after air conditioning from an air outlet (19) horizontally or slightly obliquely upward. Further, short-circuiting is prevented because the air is blown out horizontally or slightly obliquely upward. Further, even when blowing out the air downward from the air outlet (19), the first air inlet (21) is opened because it is difficult for short-circuiting to occur when the volume of the outlet air is large.
