Abstract (en)

[origin: WO2013020790A1] The invention relates to a printing press (01), wherein the printing press has at least one printing stock source (100), at least one first printing unit (200), at least one first dryer (301) and at least one second printing unit (400), wherein the at least one first printing unit has at least one first central cylinder (201), and wherein arranged within the first printing unit is at least one first printing group (211) having at least one nozzle bar (213) that has at least one print head (212) aligned on a cylinder shell surface of a body of the at least one first central cylinder, and wherein at least one carrier is arranged protruding in the radial direction over the cylinder shell surface of the body of the at least one first central cylinder, and wherein the at least one nozzle bar is arranged movably so far in an axial direction (A) that no nozzle of the nozzle bar and/or no operating region of a print head of the nozzle bar has the same position relative to the axial direction as any component of the body of the at least one first central cylinder.
