Abstract (en)
[origin: WO2012139731A1] Filling element (1, 1a) for filling containers with liquid contents, in particular for filling containers with liquid contents containing solid constituents, having at least one contents chamber (3), which is formed in a filling-element housing (2), and having a liquid valve (12, 12a, 12b), which is provided between the contents chamber (3) and at least one discharge opening (7.1) in the contents housing (2) and has at least one valve body (9, 9a, 9b) which can be moved between a position in which it closes at least one valve opening (6, 6a, 17), and thus blocks the liquid valve (12, 12a, 12b), and a position in which it releases the at least one valve opening (6, 6a, 17), and thus opens the liquid valve (12, 12a, 12b). The movement of the valve body (9, 9a, 9b) is selected in such a manner that the closing of the liquid valve (12, 12a, 12b) is carried out without a pump effect on the contents.
