Abstract (en)
[origin: WO2012140366A1] The invention relates to a system for refilling a fluid product, including: a source bottle (S); a refillable mobile bottle (N) including a dispensing pump (A), the mobile bottle (N) having a smaller capacity than that of the source bottle (S); a connecting means (C) for connecting the two bottles (F, N) together in order to fill the mobile bottle (N) with the fluid product from the source bottle (S), said connecting means including a fluid-product intake (Ip) and an air outlet (Oa) on the source bottle (S), and a fluid-product outlet (Op) and an air intake (Ia) on the mobile bottle (N), the connecting means (C) defining an internal fluid-product passage connecting the fluid-product intake (Ip) to the fluid-product outlet (Op), and an internal air passage connecting the air intake (Ia) to the air outlet (Oa), characterised in that the internal fluid-product and air passages are arranged coaxially, the air passage surrounding the fluid-product passage or vice versa.
