Abstract (en)

[origin: EP2698476A1] The method involves fixing a part of an anchorage structure within a foundation pile (2) into a sea substrate (3) under load erosion. The part of the structure is cast within the foundation pile using a curable mass. The foundation pile is provided up to a predetermined level with a load-bearing, leveling filling (4) i.e. self compacting, flowable concrete, before the insertion of the structure. The structure is settled on the filling into the sea substrate and/or into the pile under the load erosion. Casting material (8) is introduced after settling of the structure on the filling. The part of the anchorage structure is a supporting leg. The foundation pile is designed as a steel tube. An independent claim is also included for a foundation for an off-shore building.
