Abstract (en)

[origin: WO2012143631A1] A device (D) is intended to allow the securing to a floor (PL) of a vehicle of a seat (SI) which comprises a back rest (DS) fitted with a lower structural element (ES) to which is secured at least one anchoring means (MA) for securing a removable device (SE). This device (D) comprises at least i) an articulation component (PA), fixably secured to the lower structural element (ES), ii) a securing piece (PF) rotatably secured to this articulation piece (PA) and able to be secured to the floor (PL), and iii) blocking means (MB) designed to limit the extent to which the lower structural element (ES) and/or the articulation piece (PA) is made to turn with respect to the securing piece (PF) in the event of the vehicle being involved in a collision, so as to limit the extent to which the removable device (SE) moves longitudinally with respect to the seat (SI).
