Abstract (en)

[origin: EP2701065A1] The method involves providing the master (M) and slave (S) for sending and receiving the messages. The first message (N1) is transmitted both from the transmitting tasks of the master and slave to the receiving tasks (Et1M, Et1S) of the master and slave through the message handler (NhM, NhS). A message reference (N1r) for entering into a queue (Ws) of the slave is transmitted through the message handler of slave, and is displayed. The first message is passed to the receiving task of the slave by message handler, after reading out the message reference of the queue. An independent claim is included for a redundant automation system.
