Abstract (en)
[origin: WO2012146850A1] According to the invention, the body (1) has a portion (1a) capable of receiving a snap-fitting member (3) engaging with a portion of the rod (2) inserted into said portion (1a), said snap-fitting member (3) being shaped so as to occupy a first stowed position, in which the body (1) can be freely moved onto the rod (2), and a second locked position, in which the body (1) is translatably locked on said rod (2). The snap-fitting member (3) is secured to a means (4-5) capable of allowing said snap-fitting member to automatically pass from the first stowed, unlocked position to the second locked position without exerting a manual bearing force onto said snap-fitting member (3).
