Abstract (en)

[origin: WO2012146687A1] The invention relates to an analysis apparatus for the contactless analysis of the shape of a transparent body, in particular of a substantially spherical active substance bead, having at least one support for the body and at least one image recording apparatus, wherein the support has a test image, in particular a test grid, and at least one detection means is provided in order to detect, using the detection means, the three-dimensional shape and/or contour of the body and/or the test image which is modulated by the optical properties of the body, in particular the test grid. The invention also relates to a method for the contactless analysis of the shape of the transparent body.
