Abstract (en)

[origin: WO2012146719A1] The invention relates to an operating device (1a) for a light-emitting means (12). Usually, the operating device (1a) has to be configured after the installation. In order to facilitate the configuration, the connection elements (8, 9) for the energy supply of the operating device as well as the components (BA, KB) that are to be configured and the configuration means (20) are transferred into an adapter (1b) that forms an active external device part, preferably in the form of a plug. The adapter (1b) can be installed physically separated from the operating device (1a), but is connected to the same in a manner that the operating energy and eventually data can be transmitted from the adapter (1b) to the operating device (1a). The physically separated arrangement dispenses with the need to have to configure the operating device on the installation site.
