Abstract (en)
[origin: EP2702974A2] The system has a control device to enable displacement of operating table elements and an accessory (2) only within a virtual collision-free movement space. A radio identification data element (8) stores an identification data element related to the accessory. A radio reading device (7) reads the identification data element and is connected with a memory device and the control device, where the accessories of the memory- and control devices are determined again and stored in the virtual collision-free movement space as a function of the read identification data element. The radio identification element is configured as passive radio identification element such as passive transponder.
