Abstract (en)
[origin: EP2704111A1] The present invention relates to an automatic vending machine which has a lift for transporting the products from the tray area to the collection bin, which increases the capacity of the product that can be dispensed, as well as increasing the capacity of the machine, enabling the latter to store a larger number of products for subsequent dispensing, since the lift includes a folding top lid which makes it possible to position the axis of rotation of the product collection door at a greater height than the top lid of the lift, thus increasing the capacity of the lift and hence that of the products that can be dispensed, as well as the number of rows of trays.
