Abstract (en)
[origin: WO2012095586A1] The present invention relates to a signature pin interacting with a digital terminal having a capacitive screen, characterized in that the pin (P) includes a conductive circuit (10), extending from the area (ZM) for holding the pin (P) in the hand to the base (ZS) of the pin placed on the screen. The base plate (ZS) of the pin (P) comprises a pinhole grid. The conductive circuit comprises an electronic control switch (11) that makes it possible to encode a bit message to the address of the digital terminal through the capacitive screen when the user applies the pin (P) onto the capacitive screen.
