Abstract (en)

[origin: WO2012156001A1] The invention relates to a seal (1, 1'), which acts as a sterile barrier, between a first part (2, 2') and a second part (3, 3') that are designed to be movable with respect to one another, wherein a contact adhesive (11, 11') is disposed as a peripheral expandable seal (4, 4') between the parts. The invention further relates to a method for producing a seal, which acts as a sterile barrier, between a first part and a second part that are designed to be movable with respect to one another, wherein in a first step a peripheral strand of contact adhesive is applied to the outer surface of the first part in a predetermined position, and wherein in a second step the second part is positioned on the first part such that the contact adhesive adheres to the end face (13, 13') of the second part. The invention also relates to the use of a contact adhesive as a seal, which acts as a sterile barrier, between a first part and a second part that are designed to be movable with respect to one another.
