Abstract (en)

[origin: WO2012152486A1] The invention relates to a method for producing a solar cell on a crystalline semiconductor substrate (201), in particular a crystalline silicon solar cell comprising a surface layer doped differently from the semiconductor substrate and connection regions on both substrate surfaces, wherein a separating cut (211) is generated along the outer edge in one of the two substrate surfaces through the surface layer into the semiconductor substrate by means of a cutting tool guided at a predetermined distance from the edge in order to electrically insulate the two substrate surfaces from each other.
