Abstract (en)

[origin: EP2708684A1] The method involves selecting an opening corresponding to an unlocked position (7) of a driving unit (5) through a selector control unit (9) from a locking position. A handle (2) is moved in a direction according to a defined amplitude to move the driving unit from the unlocked position depending on the selector control unit, where the handle is moved between the locking position and another unlocked position (4). The driving unit is maintained in the former unlocking position against action of an elastic unit. An independent claim is also included for a control device for controlling a fitting lock e.g. casement bolt or casement bolt lock.
