Abstract (en)  
[origin: WO2012158019A1] The invention relates to a resistive temperature device comprising: -an elongated container having a closed distal end and a proximal end; -a thermistor positioned inside the container near the distal end; -connection leads connected to the thermistor and extending from the thermistor to the proximal end to connect the thermistor to a measuring device; -thermal grease arranged between the thermistor and the distal end of the container; and -thermally isolating material arranged inside the container between the thermal grease and the proximal end of the container to provide a thermal insulation between distal end and proximal end of the container.
