Abstract (en)
[origin: EP2711100A1] A rolling mill bearing chock positioning device used in steel rolling equipment comprises a first bearing chock assembly (30), an upright post (20) and a rolling mill seat (10). A stepped face (21) with a downward panel is disposed on the lower middle portion of the upright post. A retaining mechanism for retaining the upward and downward displacement of the bearing chock assembly by exerting pre-tightening pressure thereon is formed between the stepped face and the upward supporting face on the rolling mill seat. The positioning device can effectively position the lower rolling mill bearing chock by exerting pre-tightening pressure thereon.
