Abstract (en)  
[origin: EP2711463A2] The road barrier is formed as uniform segment in the form of the hollow body formed of plastic, such as polyethylene, which is filled with concrete at the installation site. The road barrier is equipped with connecting elements for connecting with the other segment of the barrier and a stabilizing element with a base. The body of the road barrier is formed of polyethylene with longitudinal walls (2) with breakings which form a molding (3) in the upper part and has a frame in the lower part. The inner side of the body is reinforced with rods in the form of two longitudinal frames (8). The longitudinal frames are embedded in the inner ribs of the body.
