Abstract (en)
[origin: EP2711482A2] The device (1) has a connection unit (4) connectable to fastening anchors e.g. eyebolts and ring eyelet screws, that are inserted in a wall. The device is brought into a stop position by pivoting the device for formation of a bend-proof frame with the connected fastening anchors. The connecting unit is arranged at opposite ends of a plate-like base body (3) and comprises a bolt-shaped or hook-shaped engagement unit (5) and a clamping element (6). The engagement unit is bringable in engagement with an aperture or a recess of the fastening anchors by pivoting the device. An independent claim is also included for a fastening arrangement for anchoring a scaffold at a wall.
