Abstract (en)
[origin: EP2711637A1] The heater has a furnace connected with hollow chamber bricks at walls (16) of a building via a channel system. The channel system comprises multiple warm air-closed loops (48), which are attached to a ground furnace (18) i.e. tiled furnace, formed by the warm air-closed loops. The warm air-closed loops form an outline ring that is guided into a traction stone unit (34). The stone unit is embedded into the walls. The stone unit is provided with the bricks, inserted into a recess (32) of the walls, and comprises channels (36) connected with each other for formation of a heating coil.
