Abstract (en)  
[origin: EP2711658A2] The exchanger (1) has fins which are arranged between the flat tubes (4) that form flow ducts through which a refrigerant is flown. The flat tubes are in fluid communication with a collecting tank (2). The refrigerant is made to flow into an inflow region (3) of the tank which is in fluid communication with the flow duct. A refrigerant passage (6) is provided from a line (5,5a) to the inflow region of tank. The passage is arranged in the middle area of the inflow region of tank where the middle area is provided in relation to direction oriented perpendicularly to a plane of the tubes.
