Abstract (en)

[origin: WO2012162782A1] A liner system and method for installing the liner. The liner is composed of a synthetic material (HDPE or LLDPE). The liner has a base and walls and an undersurface. The undersurface includes integral therewith a plurality of discrete and independent radially disposed in spaced relation stabilizing members. The stabilizing members are exposed when the walls of the liner are positioned in a substantially vertical orientation relative to the base. This exposes the stabilizing members. The container may then be positioned in segments on top of the stabilizing members with the walls of the liner adjacent a wall of the container. In this manner, the container structure is fabricated about the liner. The advantages in this system relate to the maintenance of tension of the liner and the avoidance of having to position a large disc like structure over the top and within a cylindrical receptacle or container. Conveniently, the container can be assembled about a liner expeditiously and at a fraction of the cost typically encountered with existing arrangements.
