Abstract (en)
[origin: WO2012163442A1] The invention relates to a container handling device, in particular a filling machine (1) for filling containers (5), wherein the filling machine (1) is connected downstream of a filling level control unit. Advantageously, at least one container detection element (9) is provided, which is disposed separately from the filling level control unit, upstream thereof, wherein both the filling level control unit and the at least one container detection element (9) guide respective inspection data of the containers (5) inspected independently of one another to a control and regulating device (6), wherein the at least one container detection element (9) detects and forwards at least one partial contour of the relevant container (5) as inspection data. The invention also relates to an inspection and filling process of the filling machine (1).
