Abstract (en)  
[origin: CA2837360A1] A ballistic protection means according to the invention has a multiplicity of hard ballistic shaped elements which are formed in one piece and which have at least two planes arranged offset with respect to one another. At least two of the shaped elements are fixed to one another in a shaped element assembly so as to be positioned relative to one another such that a first plane of a first shaped element engages in portions over a second plane of a second shaped element. As a result of the arrangement according to the invention of the at least two planes of two shaped elements, which engage over one another, in the shaped element assembly, practically two overall surfaces are formed which are situated one above the other and are offset with respect to one another and which advantageously make it possible for a shaped element assembly entirely without linear penetrations to be provided.
