Abstract (en)

[origin: WO2012168784A2] The invention relates to an application device for applying an active agent to material, having a housing, having a storage volume, which is arranged in the housing and is intended for storing the active agent, and having an applicator by means of which the active agent located in an application volume is applied to the material. In order to make reliable and straightforward application possible, it is proposed that the applicator has an application volume, a number of hollow teeth, which are arranged in a comb-like manner and have an upper wall and a lower wall, between which at least part of the application volume is arranged, and also has gaps, which are located between the teeth and are intended for introducing the material into the application volume.
