Abstract (en)

[origin: WO2012167890A1] The present invention relates to a method and device for sterilising parisons made of a thermoplastic material that are intended for producing blow-moulded containers. During the sterilising process a sterilising agent is introduced into an interior of the parison by an applicator. At least one gas is supplied to the applicator via a least one supply element, at least sections of which are arranged in a horizontal direction next to a transport path of the applicator. The supply element comprises at least one outlet opening facing towards the applicator. At least one pressure-applying element is arranged between the applicator and the supply element and is resiliently clamped between the applicator and the supply element.
