Abstract (en)

[origin: WO2012170366A1] Techniques for a wearable device and platform for sensory input are described, including a sensor coupled to the wearable device, the sensor capable of sensing a sensory input, a processor configured to transform the sensory input to data, the data being processed by an application configured to determine an activity being performed and to generate information associated with the activity being performed while the wearable device is worn, the activity being determined using a motion matcher configured to generate a motion profile associated with the activity, the motion profile configured to be accessed and modified when the activity is performed again, and a communications facility coupled to the wearable device and configured to transfer the data between the wearable device and another device, the data being configured to be presented on a user interface on the wearable device during the performance of the activity.
