Abstract (en)  
[origin: EP2719465A2] The dispenser has a protective device that is attachable to a feeding device in a protective position such that an accessibility and/or maneuverability of an actuating handle is prevented in a protective condition of the protective device. An enable condition of the protective device is achievable upon releasing a coupling device. The partial shells are displaceable relative to another so that the protective device is removable from the feeding device and the accessibility and/or maneuverability of the actuating handle is obtainable.
