Abstract (en)
The timepiece has a winter/summer switching mechanism driven by a timepiece movement. The switching mechanism comprises a rotating actuating element to be driven intermittently by the timepiece movement such that the actuating element performs complete rotation in one year turning in jumps. The actuating element is arranged such that rotation of the element causes dial bearing geographic indications (5) to switch along directions during course of a year. Days of the week counter drive an operating element to rotate during passages from Saturday to Sunday by the timepiece movement.
