Abstract (en)

[origin: WO2012175367A2] A refrigeration device, especially a household refrigeration device, has a heat-insulating housing that encloses a storage chamber (4). An air channel recessed in the wall surface of the housing communicates with the storage chamber via openings (14) of a blank (13) that extends between the air channel (11) and the storage chamber. Said blank (13) is fixed to the wall surface by at least one clamp (15) which has a center part (16) that rests against the side of the blank (13) facing the storage chamber and locking hooks (17) that extend away from the center part (16) and engage through at least one opening (14) of the blank (13) in undercuts of the air channel.
