Abstract (en)  
[origin: WO2012175668A2] The invention relates to a casting component for a device used to cast a molten metal. Said casting component has a metal main member (2) and a molten metal-contacting surface area (9) which is exposed to the molten metal during the casting process. The invention also relates to a method for applying an anticorrosive layer to a substrate, which can in particular be a casting component. In the casting component of the invention, the metal main member is provided with an anticorrosive layer (3) in the molten metal-contacting surface area, said anticorrosive layer (3) being resistant to the molten metal and being composed of a group of substances consisting of borides, nitrides, and carbides of the transition metals and of the alloys thereof and of boron and silicon, as well as of Al<sub>2</sub>O<sub>3</sub>, microparticles and/or nanoparticles of one or more substances being used. Use for casting receptacles and other components of aluminum die-casting machines, for example.
