Abstract (en)

[origin: EP2724760A1] The device has a jaw (20) for holding a heel of a ski shoe, where the jaw pivots about a rotation axis (A) provided transverse to a gliding device. The jaw is arranged with an actuation lever (30). A heel lift wedge (41) is able to switch between an operative position (PA1) in which the wedge rests on the jaw to form a lower stop, and a passive position in which the wedge does not interfere with vertical movement of the heel. The wedge is arranged separate from the actuation lever. An independent claim is also included for a shoe fastener.
