Abstract (en)
A power tool (10) includes a motor (21) that generates rotational power and a power transmission unit (22) that transmits the rotational power from the motor to an output shaft (25). The power transmission unit is configured to reduce a rotation speed related to the rotational power and be capable of shifting a speed reduction ratio. A gear shift actuator (27) shifts a speed reduction ratio of the power transmission unit. A torque detector (41) detects a load torque applied to the output shaft. A control unit (23) controls the gear shift actuator to shift the speed reduction ratio of the power transmission unit in accordance with the detected load torque. The control unit reduces an output of the motor until a predetermined time elapses from when the control unit increased the speed reduction ratio of the power transmission unit by controlling the power transmission unit.
