Abstract (en)
A linen drying device comprising: i) a drum (2) that can rotate and is intended to house the linen to be dried and/or washed; ii) a housing compartment (3) of the drum (2); iii) a condenser (4) that receives a gaseous fluid containing particles of vapour from said compartment (3) and that causes at least partial condensation thereof; iv) a blowing unit (5) in turn comprising: -a movement impeller (51) of the gaseous fluid; -a casing (52) that houses the impeller (51), is placed in fluid communication with the condenser (4) and is downstream of the condenser (4) along the outflow direction of the gaseous fluid, said casing (52) comprising a first and a second semi-shell (53, 54). The condenser (4) and the blowing unit (5) are placed along a line (7) that takes said gaseous fluid out of the compartment (3) and reintroduces it into the compartment (3). The first and the second semi-shell (53, 54) are made of sheet metal and are connected to each other through a seaming (9).
