Abstract (en)
[origin: EP2725287A2] The lamp (1) has optic and housing modules (14, 13) formed such that the optic module is connectable with the housing module in two alignments. A directional characteristic (16) of a light emitted from the lamp differs during connection of the optic module with the housing module in the alignments. The optic and housing modules are formed such that separation of the optic module from the housing module and connection of the optic module with the housing module are enabled by changing the alignments. The optic module comprises a diffuser, a prism element, a lens cluster and a reflector grid.
