Abstract (en)

[origin: WO2013002725A1] The present invention relates to a plastic container for carrying items, to a method for manufacturing a container, and to the use of a container, which container comprises a base member and at least one side wall comprising an inner side surface and a bottom edge which is hingedly connected to at least one edge of the base member, wherein the at least one side wall is pivotally movable between an upright position and an outwardly folded position in relation to the base member. Furthermore, the inner side surface of the at least one side wall essentially coincides with a geometrical plane of the support surface of the base member, when the side wall is arranged in the outwardly folded position. The container further comprises a raise resisting locking device arranged to prevent the side wall from unintentional raising, when the side wall is arranged in the outwardly folded position.
